Who are True?

True Corporation Public Company Limited ('True') is one of the largest communications companies in Thailand. True operates Thailand's largest cable TV provider TrueVisions, its largest ISP TrueOnline and one of Thailand's largest mobile operators, TrueMove H. True is innovating in the software development space through their TrueID App and Digital & Media Platform.

True currently has around 40 APIs that are integral to powering the extensive mobile and web applications that serve over 10 million customers every single month. Whether it's live TV broadcasting around Thailand, or facilitating self-service payments, these applications are part of True's core product range.

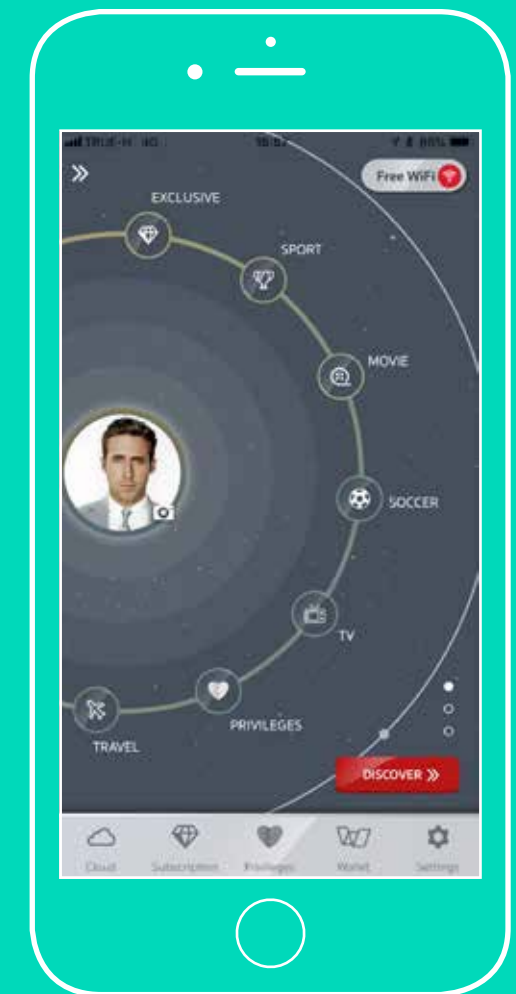

What API challenges did True face?

The applications that True use their APIs for are central to customer experience - without them, users can't complete their usual day-to-day transactions or even watch the English Premier League. If an application is unavailable, it can also have huge financial and reputational implications across the business - whether it's logistics, order processing or even revenue generation.

True needed to ensure that their APIs had a single access point of integration and authentication, with high capacity and cost-effective scalability for the millions of customers they serve. They also wanted to minimise the risk of poor and inconsistent API security as much as possible, and secure their APIs throughout the process.

All of these complexities needed to be addressed across the suite of 40 True APIs, but using a provider that didn't get in the way of True's day-to-day operations or time-to-market on new apps.

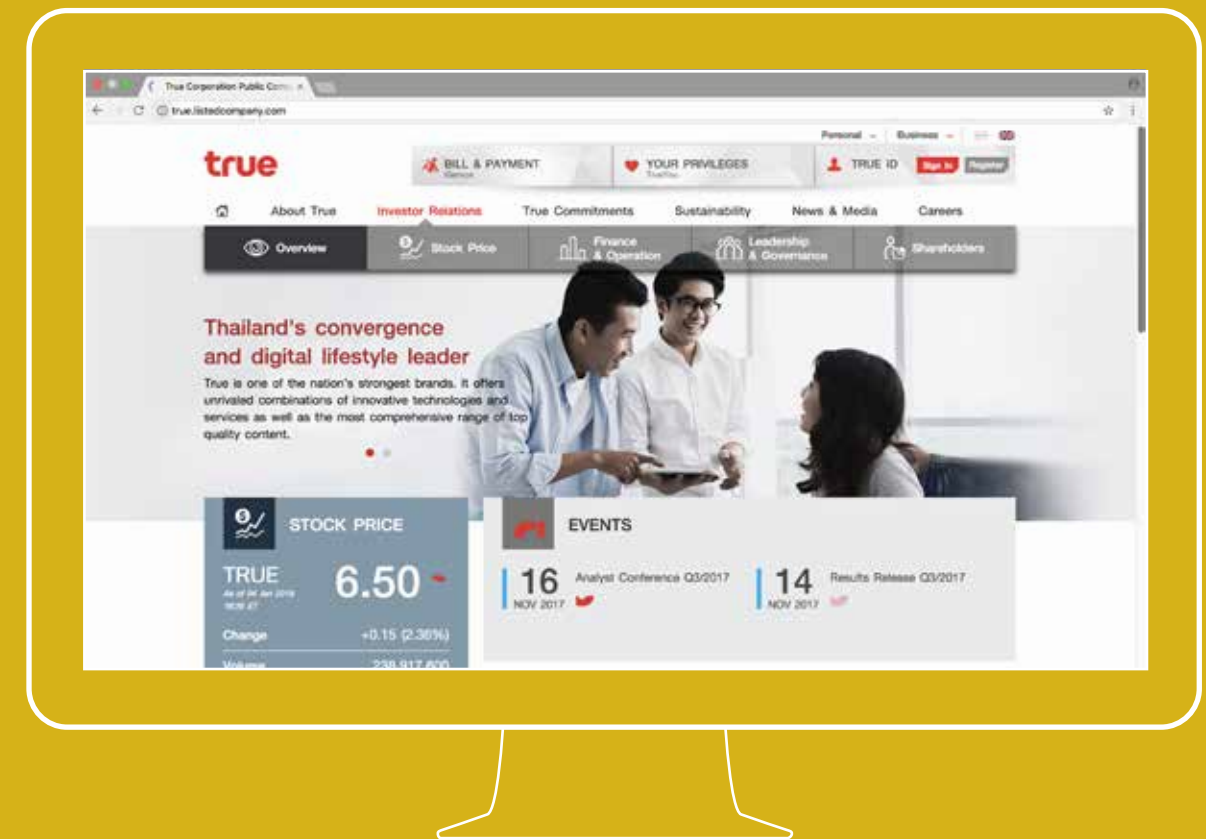

Why did True turn to Tyk? (Part I)

After doing some online research into possible API Gateway and Management solutions, True quickly honed in on Tyk's compatibility with their needs.

First of all, Tyk stood out for its ability to scale and ease of implementation. Tyk's lightweight API management solution allowed True to get all 40 of their APIs up and running, and the new solution embedded into their technical team, within a month of installing. Given the importance of APIs to True's business, this was a key factor for choosing Tyk.

High scalability also means that future innovation is deftly supported, improving time-to-market for new API-led products.

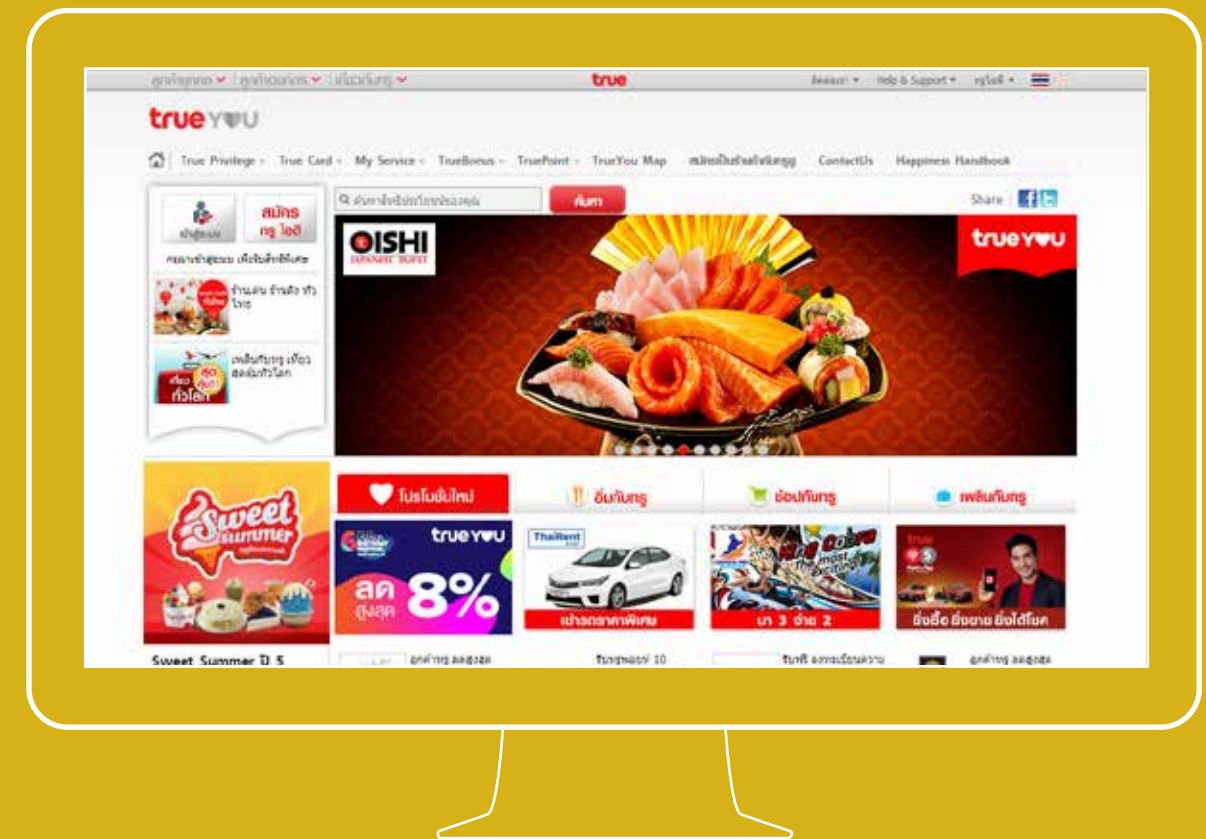

Why did True turn to Tyk? (Part II)

True also identified that the range of management tools Tyk offers would help them with future innovation as well as day-to-day API requirements.

The range of authentication tools, rate and quota management solution, and ability to fine-tune API access control, means that Tyk not only helps True to manage their existing APIs more acutely, but also allows them to experiment with other monetisation and productisation ideas. API usage reporting brings additional insight to their API strategy and operations.

Finally, the ability to deploy on-premises, and support multiple data centres from one central dashboard gave True the control and visibility they need to continually refine and innovate.

What was the impact of Tyk on True's API Management?

True found Tyk simple and straightforward to get started with. Once in production, True immediately noticed that their workflows and integration for front-end apps became much easier to manage.

Now, once they've developed a new API, they simply load it into Tyk and create the policy and token for the relevant client, making innovation for True, and their clients, quicker and easier.
